Climate Change: Its causes and impacts

Professor Dr Fredolin Tangang

IPCC Working Group I (WG I) Vice-Chair & Head, Research Centre for Tropical Climate Change System (IKLIM), Universiti Kebangsaan Malaysia (UKM)

UNIVERSITI KEBANGSAAN MALAYSIA The National University of Malaysia

Public Lecture at Universitas Indonesia, Jakarta, Nov 27, 2012

Climate Change

"Climate Change has been recognized as the most pressing environmental problem that the world will be facing in the 21st century"

Outline

- Introduction
- Introduction to IPCC & how it functions
- Scientific Understanding of Climate Change
- Climate Change Impacts
- COP meetings and its roles
- Summary

What is Climate Change?

.... if you google "climate change" ...

STOP CLIMATE CHANGE BEFORE IT CHANGES YOU.

Inter-governmental Panel on Climate Change (IPCC)

UNGA 42 proposed the establishment of IPCC and in 1988 IPCC was established under WMO and UNEP

Authors, Contributors, Reviewers

THE IPCC BUREAU

Chairman

Why IPCC?

- Prior to the establishment of IPCC, growing number of literatures indicate the Earth's climate system is warming due to increasing GHG concentration in atmosphere
- Independent, objective, fair and transparent assessment of the state of global climate system is required
- The establishment of IPCC was for this purpose
- The IPCC provides such assessment and this becomes the source of information to policy makers and UNFCCC on 1. causes of climate change, 2. potential impacts on built and natural systems and socio-economic, 3. possible response options.
- IPCC Reports are **policy-relevant** NOT **policy-prescriptive**
- Four assessment reports so far & AR5 will be out by 2013.

IPCC Reports

Climate Change 2013

FAR 1990

SAR 1995

TAR 2001

AR4 2007

AR5 2013

IPCC had produced 4 Assessment Reports plus several other special reports including the recently released SREX &

SREX (2012)

How IPCC produces this its reports?

at this stage

IPCC Assessment Process

Key « Rules » for IPCC Work

- COMPREHENSIVE all the latest relevant scientific, technical and socio-economic literature published wordwide is assessed
- BALANCED differring views are reflected in the reports
- OPEN selection of authors from all countries and relevant discipline, wide review process by experts and governments
- TRANSPARENT strict clear procedures

Dr Edvin Aldrian Director Center for Climate Change and Air Quality Agency for Meteorology Climatology and Geophysics BMKG, Indonesia IPCC WGI Lead Author (LA) for AR5 Chapter 14: *Climate Phenomena and their relevance to Future Regional Climate Change*

--- the only scientist from the Southeast Asia region in the LA team

The IPCC Fourth Assessment Report (2007)

(WG I)

(WG II)

(WG III)

"Warming of the Earth's Climate System is unequivocal" (IPCC AR4, 2007)

Global Mean Temperature

Changes in surface and tropospheric temperatures

(IPCC 2007)

Changes in Atmospheric Water Vapor

ATMOSPHERIC WATER VAPOUR

WV increases consistent with warming atmosphere

Expected to provide strong positive feedback and enhances the warming

Changes in Sea Ice Extent

Arctic Sea Ice extent 1980 – 2005 decreases -2.7% per decade

Summer minimum Arctic Sea Ice extent decreases -7.4% per decade

New studies indicate Arctic Sea would be ice-free during summer sooner than expected (IPCC will asses this AR5)

Antarctic sea ice extent: no significant trend

Changes in Glacier Mass Balance

Cumulative loss of glacier mass over many regions

During the 20th century, glacier and ice caps have experienced widespread mass losses and have contributed to sea level rise

Changes in Ocean Heat Content

Ocean

INTERGOVERNMENTAL PANEL ON Climate change

temperatures have increased to depths of at least 3000 m

Ocean warming contributes to sea level rise due to thermal expansion

Changes in Global Mean Sea Level

GLOBAL MEAN SEA LEVEL

Sea level has been rising since 1961 at an average rate of 1.8 mm/year

The rate accelerated since 1993 at 3.1 mm/year.

Changes in Precipitation

Observed changes in precipitation (2)

(IPCC 2007)

What drives Climate Change?

The greenhouse effect

The natural greenhouse effect increases surface temperatures by about 30°C.

Increasing greenhouse gas concentrations tends to increase surface temperatures.

(IPCC 2007)

Greenhouse Effect was discovered in early 1900

Svante Arrhenius

• Published a paper in early 1900 highlighting the greenhouse effect

• The first person to predict that emission of CO₂ from burning of fossil fuels would cause global warming

(1859-1927, Nobel Prize for Chemistry 1903)

• Predicted doubling of CO₂ would result 5-6°C increase in mean temperature (IPCC projection was 2-4.5°C)

• Predicted it would take 3000 years to double the CO_2 concentration (IPCC estimated this would be achieved within this century).

GHG Emission in 20th century

Dramatic increase of GHG concentration the atmosphere since the beginning of European Industrial Era

Global anthropogenic GHG emissions

Monsoon & Dominant Modes of Climate Variability

Indian Ocean Dipole (IOD), El Nino-Southern Oscillation (ENSO) ----Interannual oscillation (2-7 years)

Madden-Julian Oscillation (MJO) – intra-seasonal oscillation (20-60 days)

El Nino Modoki becomes prevalence after 1980s due to changes on ocean sub-surface temperature distribution along the equatorial Pacific (Ashok et al. 2007; Kug et al. 2009)

Climate model projections for 21st century shows the coupled atmosphere-ocean in the tropical Pacific prefers the El Nino Modoki (Ashok et al. 2007) How much we understand ENSO impacts on Southeast Asia region?

Impacts of conventional El Nino vs. El Nino Modoki on Malaysian/ Indonesian climate?

Global warming & ENSO. More El Nino Modoki? What would be the impacts on Malaysian / Indonesian Climate

---- Limited literatures

Typical evolution anomalous SST associated with an El Nino (La Nina)

Juneng and Tangang (*Clim Dyn .* 2005)

Evolution of ENSO Signal over SEA is modulated Ocean-Atmosphere Interaction

SIO Region

NWP Region

How these regional atmosphere-ocean interactions evolve under a warmer environment? (Wang et al. 2003)

Composites of Anomalous DJF Precipitation

Indian Ocean Dipole

Relationship between IOD & Malaysian / Indonesian climate?

IOD & Global Warming? Impact on Malaysian / Indonesian climate ?

Projected $\Delta T \sim 1 3^{\circ}C$

World Energy Council, 2004

Population, Wealth & Emissions

Drivers of Anthropogenic Emissions

The future of the climate system (and our survival) depends on our ability to decouple future emissions from the other two factors: population and economic growth

Regional distribution of per Capita GHG Emissions

t CO2-eq/cap

Annex I countries with ~20 % world population, produced 57% of world's GDP and 46% of emissions

(Source: IPCC 2007)

Agreement to cut emissions by all countries in the world depends on the successful and effectiveness of the COP meetings.

Summary

- Climate change is real and it is the result of unsustainable practices
- Climate Change is projected to intensify in decades to come. With current GHG concentration of 460 ppm and increasing at 2.5 ppm per year, an increase of 4°C in global mean temperature by end of 21st century is almost certain
- Humanity can be greatly impacted by climate change in decades to come
- The world needs to move to low carbon economy and drastically decouple GHG emissions from energy and wealth growth
- Failure / slow progress at COP meetings reflect the ineffectiveness of the world political / economic system to deal with the problem
- Educating the citizens about climate change and the choices he or she can make is important
